

Guide to Getting Images into Command Image Folder

See the disclaimers at on the last page.

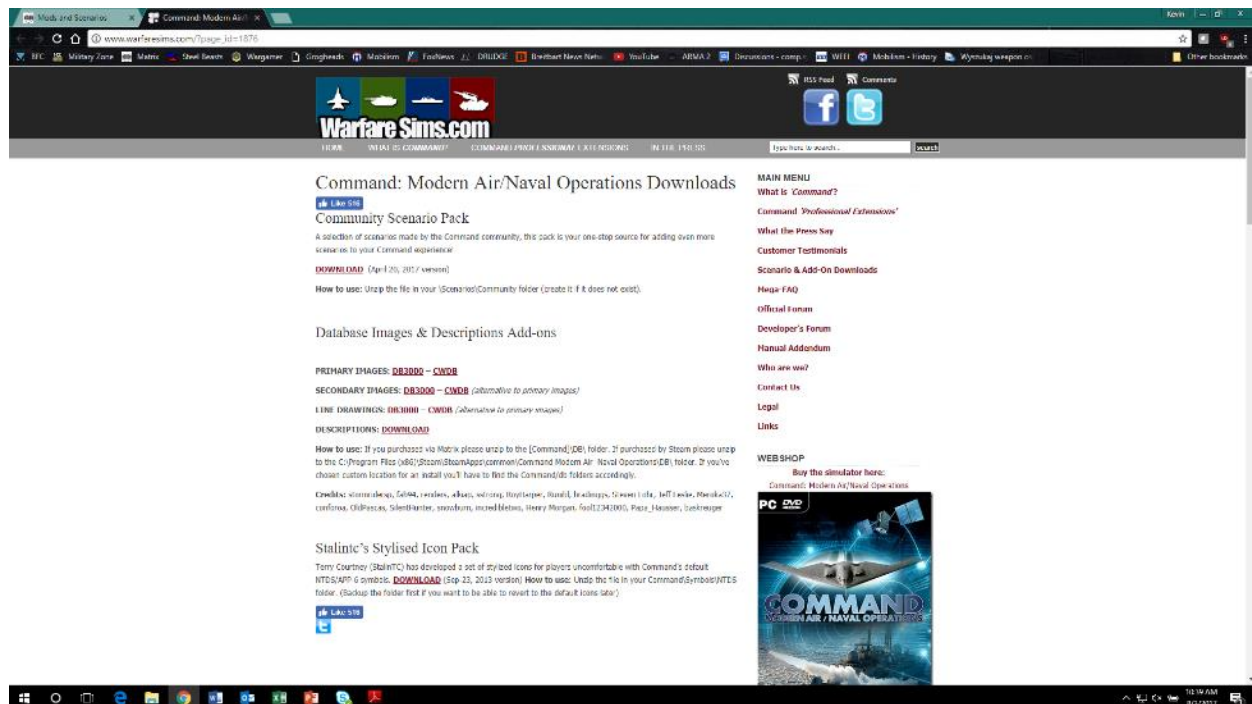

A lot of people seem to have issues with getting the image, and scenario, packs from the website into their Command Image folders. I have created this guide with pictures so people will have a little guidance on performing the task.

Go to this site that can be reached at the top of the Mods subforum on the Matrix forum;

Or use this link...

http://www.warfaresims.com/?page_id=1876

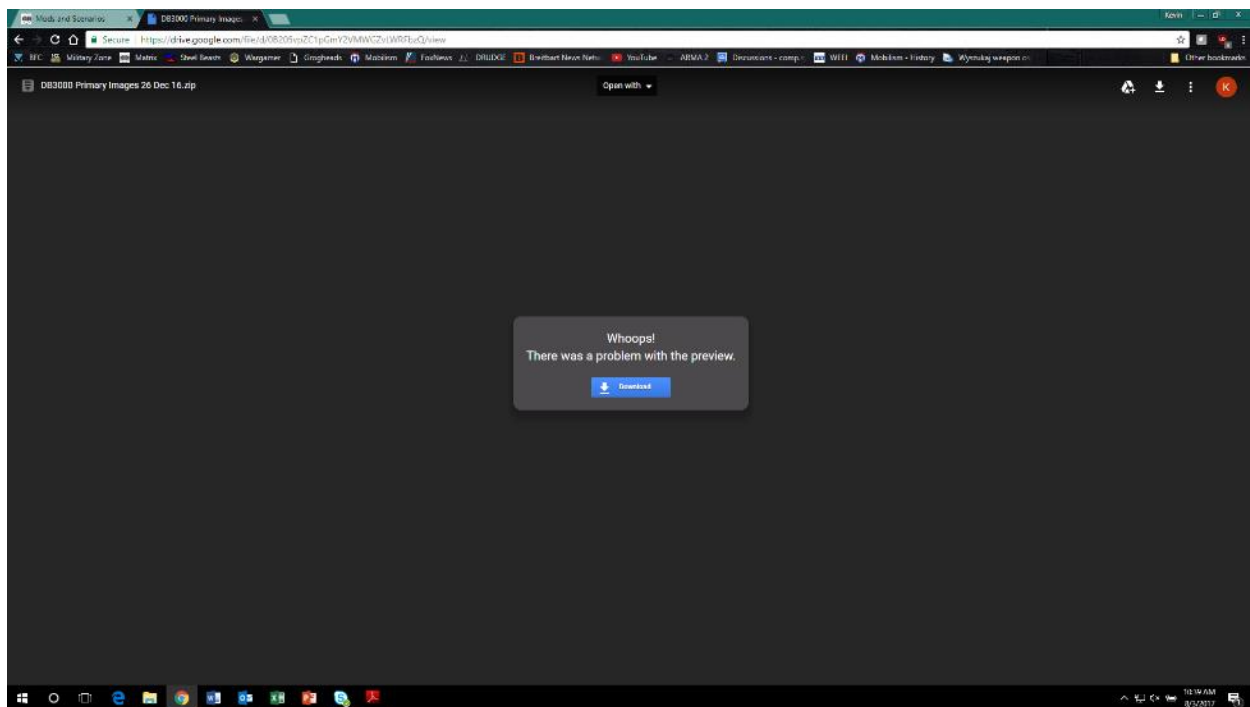

You will see the screen below:

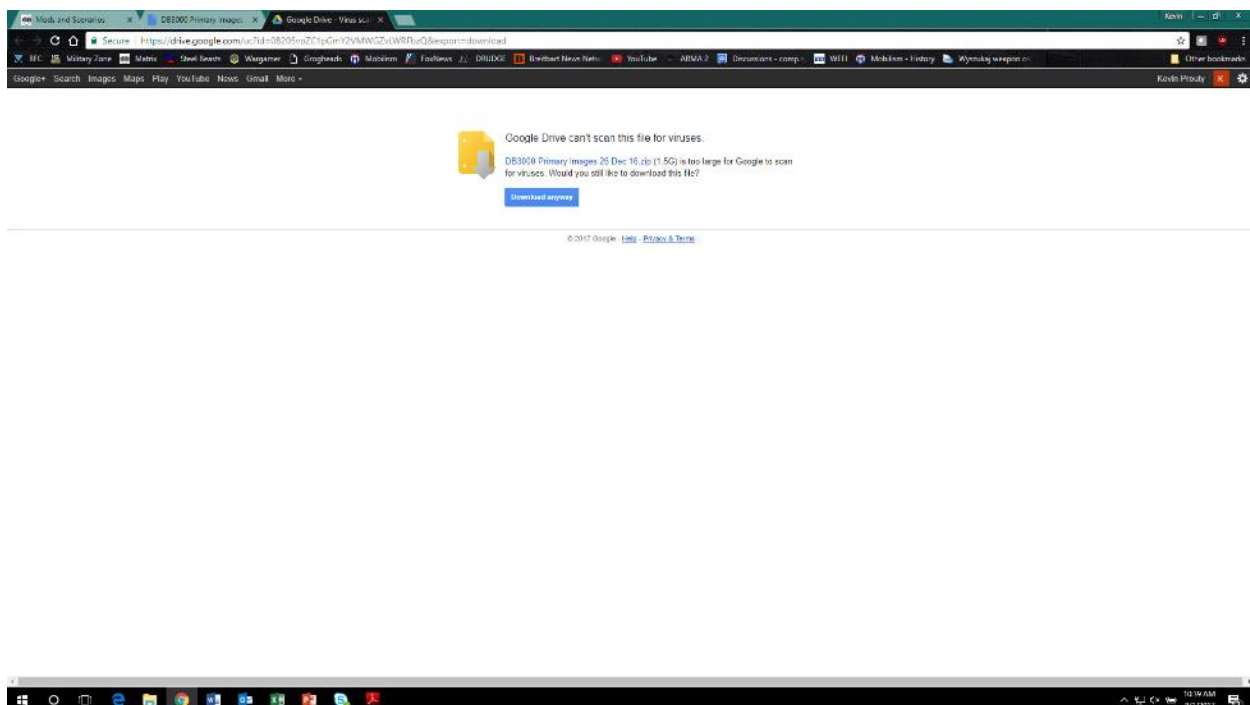

When you the Primary Images: DB3000 link...

You end up here... <https://drive.google.com/file/d/0B205vpZC1pGmY2VMWGZvLWRFbzQ/view>

Like the image below:

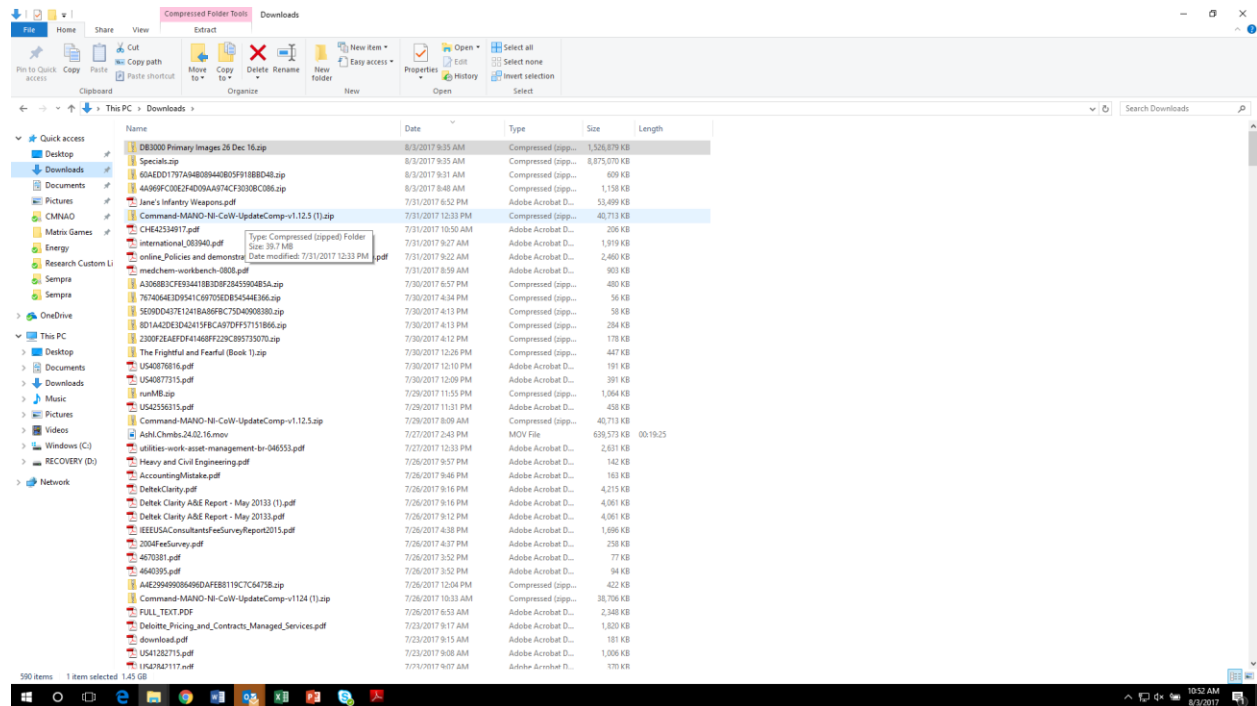

Ignore the error, it just means you can't preview the file on Google Drive. When you click on Download, you'll end up at the below screen.

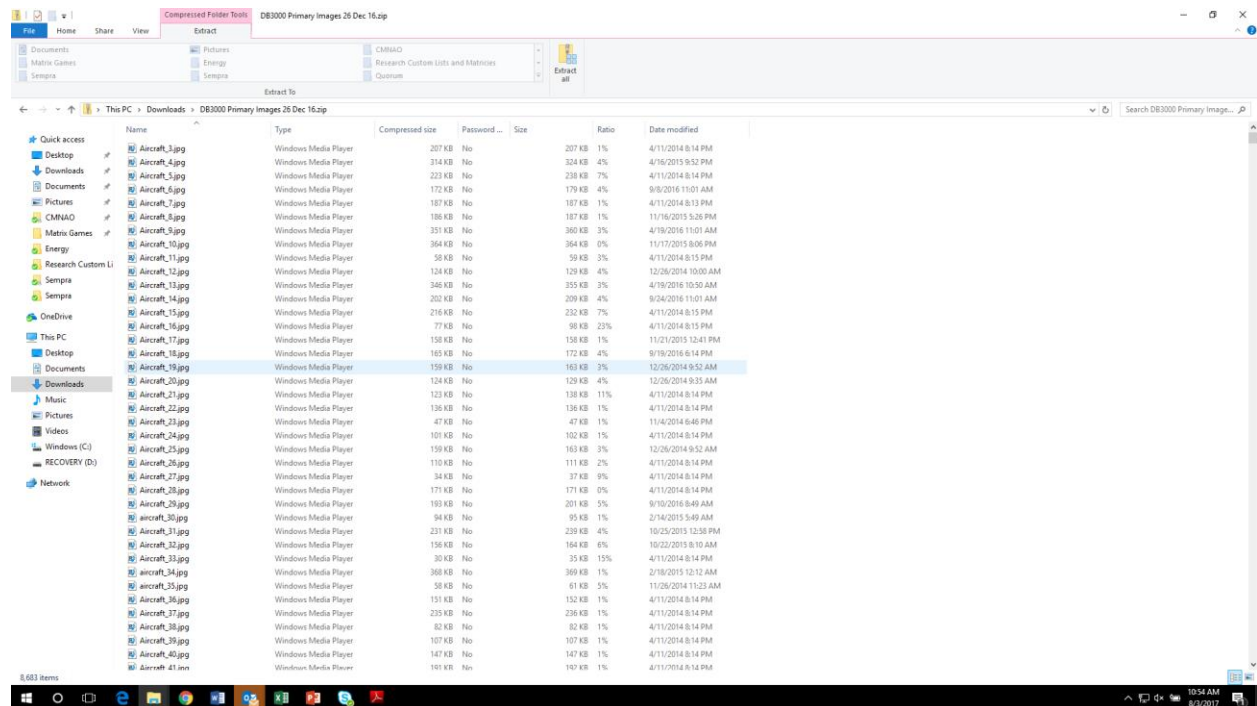

Click on Download Anyway. You should then see the file download progress message at the bottom of your browser if you use Chrome. If not using Chrome, you should have some notification of the download and its progress. It will take some time. It's a very big file

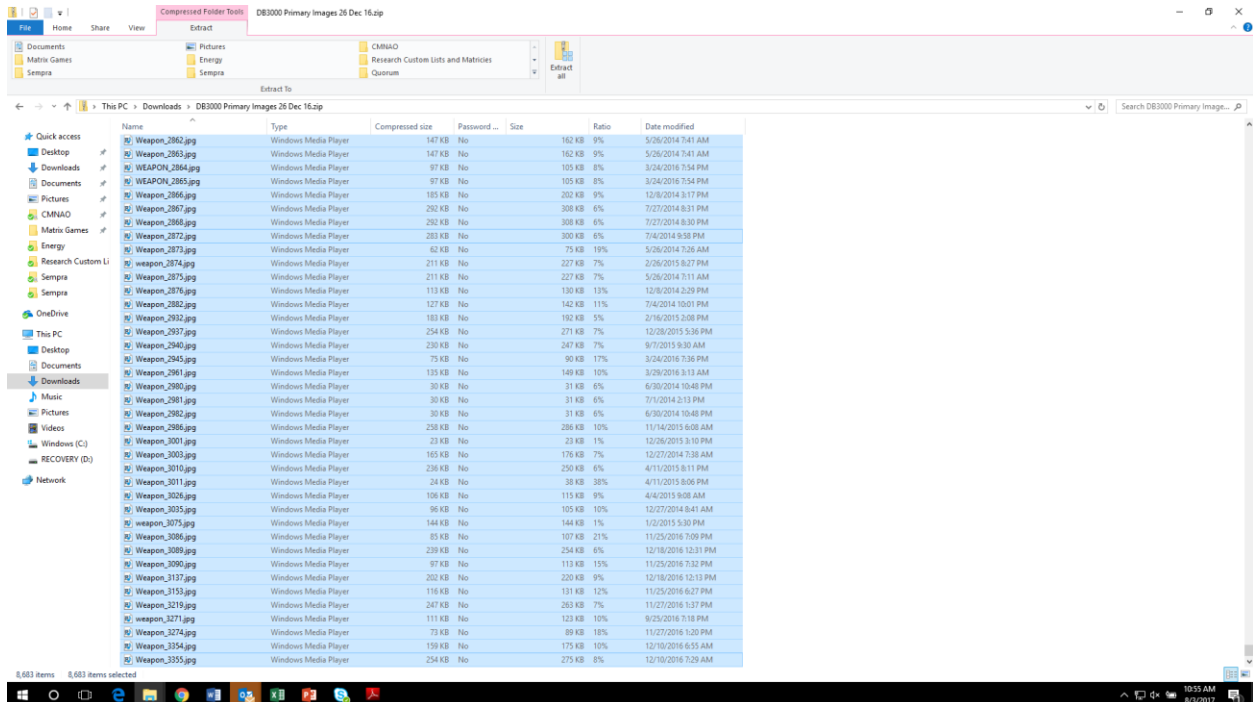

When it's done downloading, your file download location should have a file called "*DB3000 Primary Image 26 Dec 16.zip*". The date in the name changes with the date Community updated the file on the website. The "26 Dec 16" means that was the last time images were added.

If you double-click on that file, the file opens and shows the list of images. Depending on your settings, You might have a list, thumbnails, etc. It's a Windows thing.

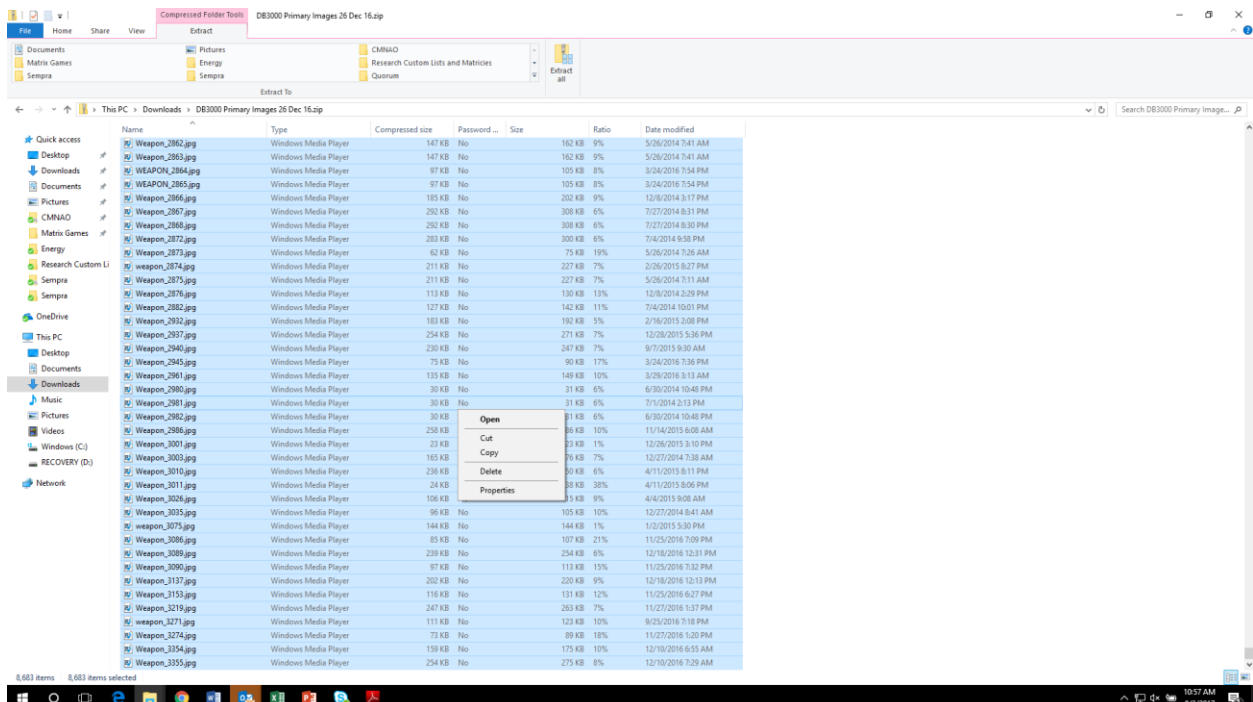

You must highlight all the files. There are multiple methods for doing this and I am sure you are smart enough to figure it out. Again, it's a basic Windows thing.

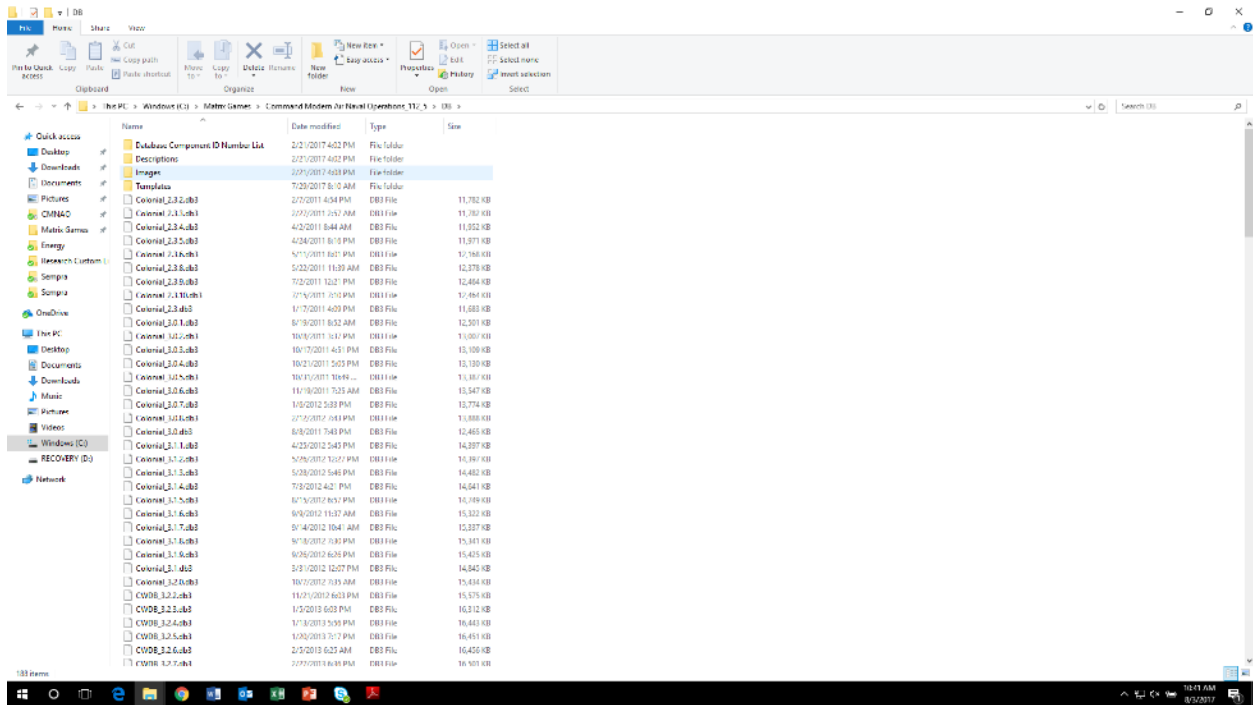

Right click on any highlighted file and you'll get this warning if you are on Windows 10. Click on Yes.

Now you will see the menu with Copy and Paste as options. Click copy.

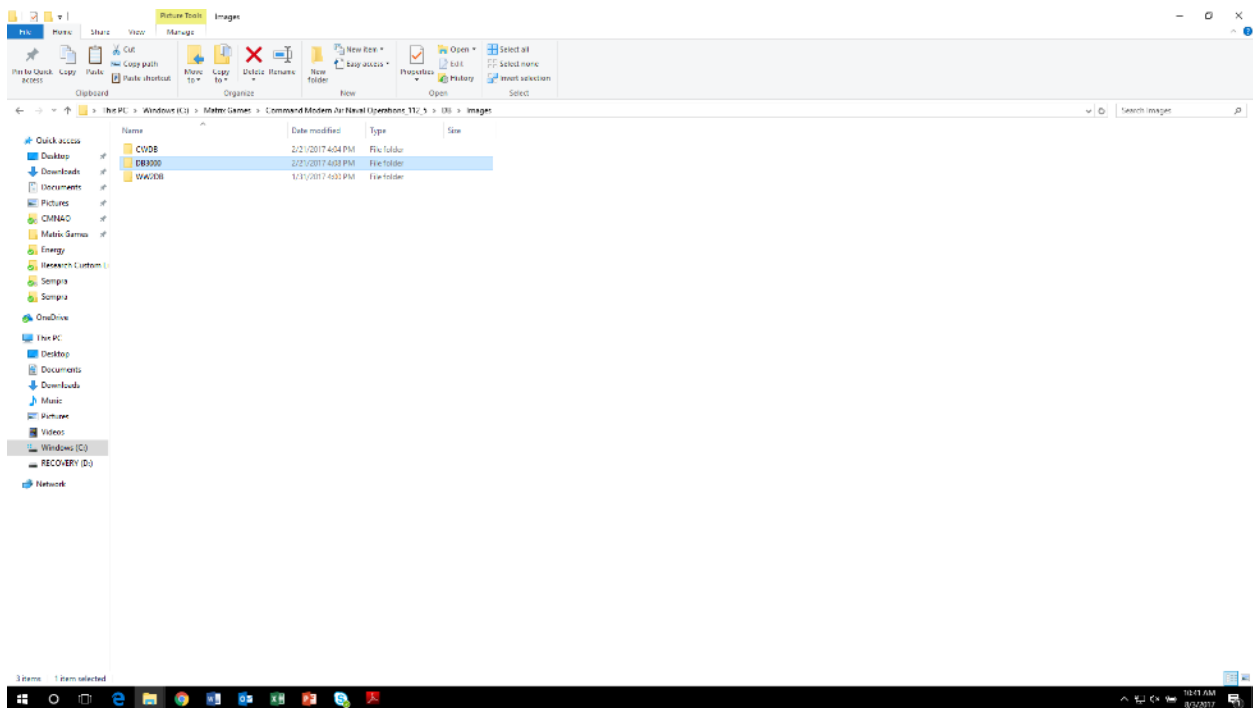

Then go to the DB directory in the Command directory.

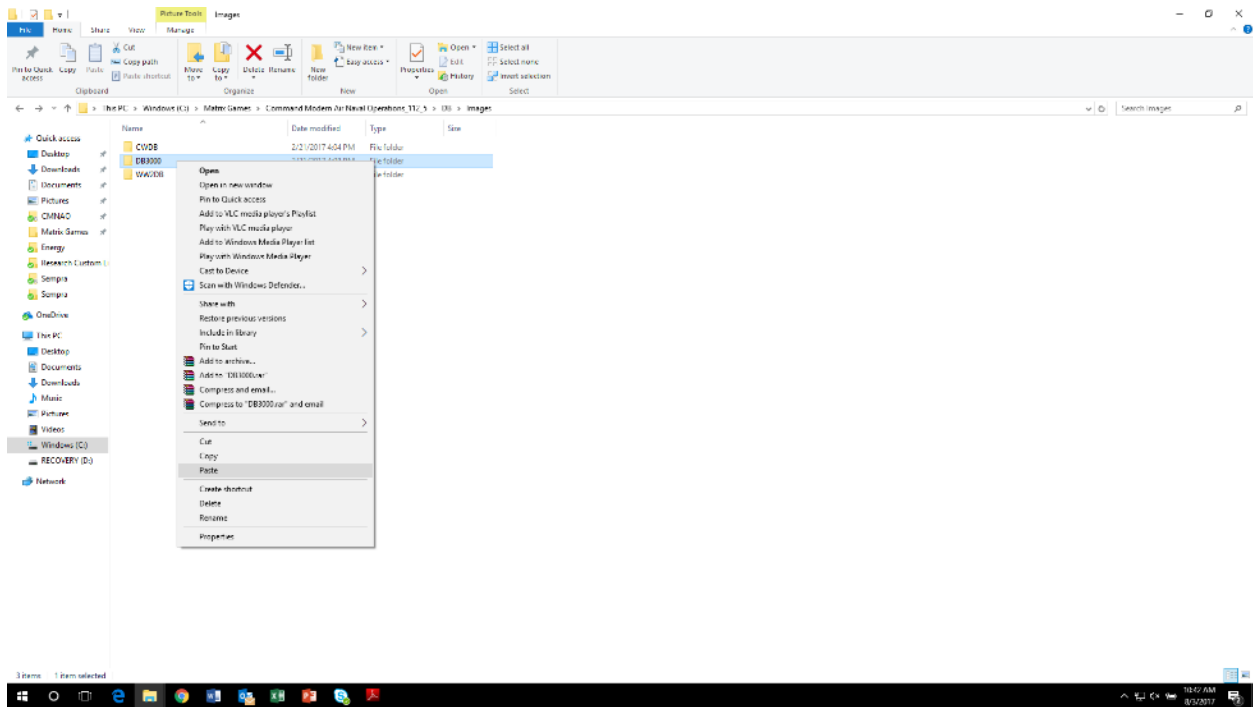

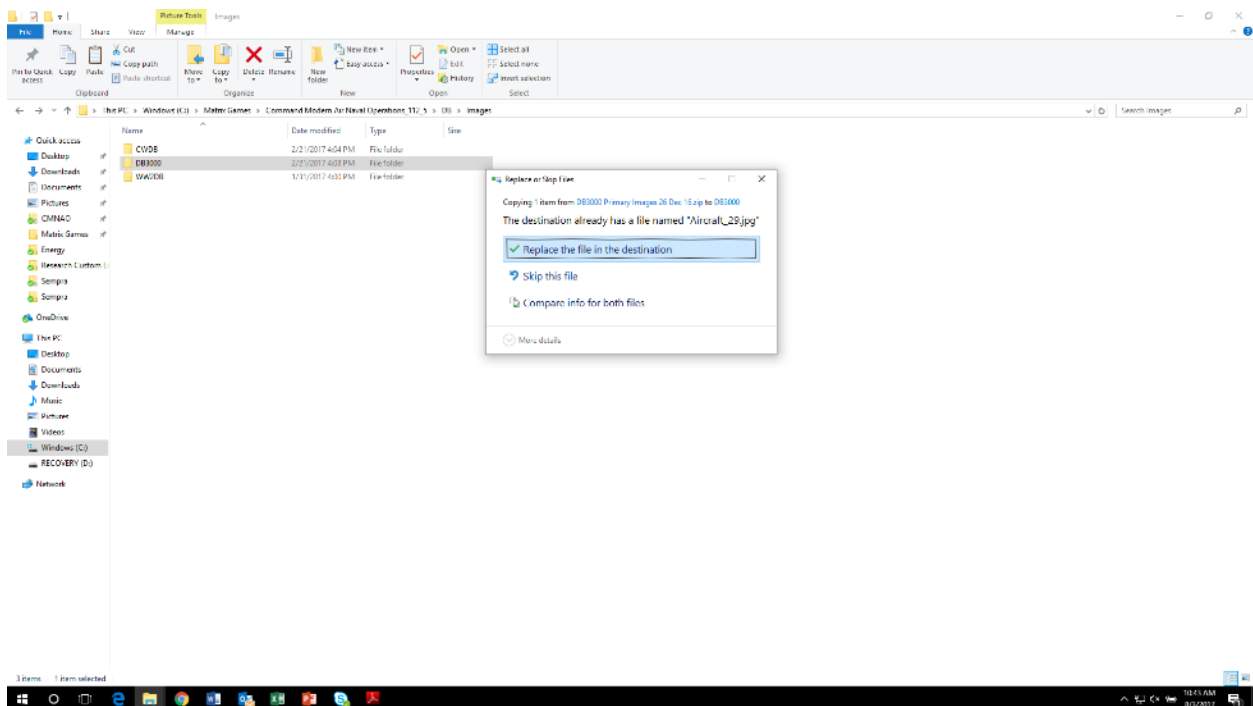

That should bring you to the following screen.

Right click over the directory DB3000. You'll have some kind of menu with an option for Paste. Click on Paste.

If you are on Windows 10, you eventually get a question about replacing existing files. I usually just say replace. If you have some custom files, they might get overridden. But if you do have custom files, you shouldn't need this guide. Be patient, it's a big group of files

Disclaimers...

1) If you can't work your way through this guide, you might be playing a game that is beyond your skills. There are some basic PC skills needed to operate a complex game that can be customized. That's just fair warning.

2) If you are on Windows 7, the screens won't match exactly and you are on your own.

3) The process is generally the same for other image files and descriptions. Directories names and such are obviously different.

4) The key is that people get confused by the term DB:

- DB is the file or files that hold the game data. **Don't screw with them.**
- Images are the pictures for the Database viewer and are split between DB3000 and CWDB, inside the DB Image directory.
- Same for Descriptions.

5) If you struggled with this, don't bother downloading Secondary Images or Line Drawings. They won't be worth your effort.
