Notes:

- Unit supply levels are situation dependent. As a general rule of thumb, you might wish to set the unit supply levels similar to the force supply stockpile levels. But in most cases campaigns occur after periods of relative quiet. Except for those recently involved in combat, most units should start at levels very near 100% in most scenarios. This is particularly true of the attacking force, which would usually have stockpiled supplies in units prior to launching an offensive. Even units belonging to a force with a low force supply stockpile level might have 100+ supply levels at the start of a scenario. This is particularly true of the Soviets after 1942.
- Remember the effects of theater transport capacities on supply distribution. If you have heavily motorized forces, or if you have very large transport capacities, you may need to drop your force supply stockpile levels a bit. Check the effective supply levels using the Situation Briefing in the game after you have designed your scenario. Forces should generally not have effective supply levels above 50%; otherwise all units will tend to recover very rapidly from operations.
- Commonwealth unit characteristics should be similar to United Kingdom characteristics.
- These suggestions are for typical front line units. Elite units should have generally higher values, and second line units should have lower values.
